                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the ProS8-1vsS9-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence encodes mutant SK K59E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPLg) to plasmin (HPLm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as cute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 165

Harvesting a desired polypeptide produced by a recombinant host cell, for producing pharmaceuticals, comprises selecting a recombinant nucleic acid comprising nucleic acid fragments encoding a leader peptide and the polypeptide.

Claim 4; Page 82-83; 109pp; English.

The invention relates to a novel method for harvesting a (poly) peptide produced by a recombinant host cell. The novel method involves selecting a call comprising a first nucleic acid encoding a leader peptide and a second nucleic acid fragment encoding the desired (poly) peptide. The first and second fragments are within the same open reading frame of the first nucleic acid and the leader peptide is functionally equivalent to an N-terminal leader peptide found with the pre-peptide of a lantibiotic. The host cells and nucleic acids are useful for producing, harvesting and post-translational modification of polypeptides. The polypetides may be used in the production of pharmaceuticals, e.g. as antigen for vaccine or

The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising a deministering to the subject a fibrin-dependent streptokinase protein; a concleic acid (1) encoding a modified bacterial streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase; (3) an concretal fibrin-dependent plasminogen activator is useful for dissolving to bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in patients with a thrombosis. The modified streptokinase can infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, cyraft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a substrate site for proteolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold. The present sequence represents native streptokinase at least two-fold. The present sequence crepresents native streptokinase (18K). (Updated on 17-OCT-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SQELLAQAQSILNIQAHPGYTIYERDSSIVTHDNDIFRTILPMDQEFTYRVKAREQAYRIN 255
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               KADILIKAIQEQIIANVHSNDDYFEVIDFASDATITDRNGKVYFADKDGSVTLPTQPVQEF 135

               ð
The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the Pro58-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present segmenc represents native SK. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPIg) to plasmin (HPIm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as a cute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistent to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                          Streptococcus equisimilis H46A; streptokinase; mutant; fibrinolytic; plasma clot, hydrolysis; haemolytic Streptococcus; plasminogen; plasmin; serine protease; fibrin; blood clot; thrombolytic; vascular thromboembolytic symptom; acute myocardial infarction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           streptokinase polypeptide - useful as plasmin-resistant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a native streptokinase. The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (PI) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase-specific antibody and reduces thereapy, and to prevent or treat glomerulonephritis and rheumatic fever. CC This sequence represents the human Streptococcus equisimilus streptokinase protein sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a Polypepide fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, and streptokinase (SK), which are capable of plasminogen (PG) activation, and fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid Ap possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a mimal or human PG. The hybrid streptokinase-fibrin binding domain colorypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of netural streptokinase in being characterised by a temporary delay, or lag several minutes in the natural rate of the catalytic conversion of the vascular system without significantly activating the circulating can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating bloom incompleted blasminogen activation encountered during clinical use overcomes systemic plasminogen activation encountered during clinical use of streptokinase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   induces fibrin-dependent plasmingen activation in a pharmaceutical composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising and instantial to the subject a fibrin-dependent streptokinase protein; a administering to the subject a fibrin-dependent streptokinase, is administering to the subject a fibrin-dependent streptokinase; (3) an uncleic acid (1) encoding a modified bacterial streptokinase; (3) an expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a blood clots in patients with a thrombotic condition, e.g. myocardial infaction, venous thrombosis, pulmonsty embolism, crebral thrombosis, infantation, venous thrombosis, pulmonsty embolism, crebral thrombosis, graft thrombosis and arterial hrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             456

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a substrate site for proteolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold. The present sequence represents a streptokinase and maltose binding protein fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              397 SQLVVSVAGTVEGTNQDISLKFFEIDLTSRPAHGGKTEQGLSPKSKPFATDSGAMSHKLE

The present sequence is mutant SK K5B. SK is a secretory protein of plasmin (HPIM), which is a serine protease able to catalyse the plasmin (HPIM), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K5B mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Streptococcus equisimilis H46A, streptokinase; mutant; fibrinolytic; plasma clot; hydrolysis; haemolytic Streptococcus; plasminogen; plasmin; serine protease; fibrin; blood clot; thrombolytic; vascular thromboembolytic symptom; acute myocardial infarction;

                                                                             1;
streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, opt. as a bolus rather than by continuous infusion. (Updated on 17-OCT-2003 to standardise OS field)

This sequence represents the wild type plasminogen-binding fragment of streptokinase. This fragment was used in the design of a modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, opt. as a bolus rather than by continuous infusion. (Updated on 17-ocr-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ENASYHLA 382
                                                                                                                                                                                                                                                                               Sequence 813 AA;
```

```
This sequence represents a fusion protein between maltose-binding protein and a modified form of the plasminogen-binding fragment of streptokinase containing 5 point mutations. This modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    241 KKSGLNBEINNTDLISEKYYVLKKGEKPYDPFDRSHLKLFTIKYVDVDTNELLKSEQLLT 300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modified forms of streptokinase resistant to enzymatic cleavage - useful as thrombolytic agents in treating thrombosis and in medical equipment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SQELLAQAQSILNXNHPGYTIYERDSSIVTHDNDIFRTILPMDQEFTYRVKNREQAYRIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         KADLLKAIQEQLIANVHSNDDYFEVIDFASDATITDRNGKVYFADKDGSVTLPTQPVQEF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઢ
                                                                                                                                                                                                                                                                                             This sequence represents a fusion protein between maltose-binding protein and a mutant form of the the plasminogen-binding fragment of streptokinase which has the N-terminal 14 amino acids deleted. This fusion protein was used in the design of a modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a fusion protein between maltose-binding protein and the plasminogen-binding fragment of streptokinase. This fusion protein was used in the design of modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified forms of streptokinase resistant to enzymatic cleavage - useful as thrombolytic agents in treating thrombosis and in medical equipment.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                            1 SQLVVSVAGTVEGTNQDISL.....IITVYMGKRPEGENASYHLA 368

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
